PAGE 1 PRACTICAL TASK — VERIFICATION REPORT

AI Coding Agents: Intern se Confident Developer Tak

20 October 2026

Objective

Show that a code change must be checked with executable tests and actual output, not accepted only because an AI assistant claims it is correct.

Implementation and test coverage

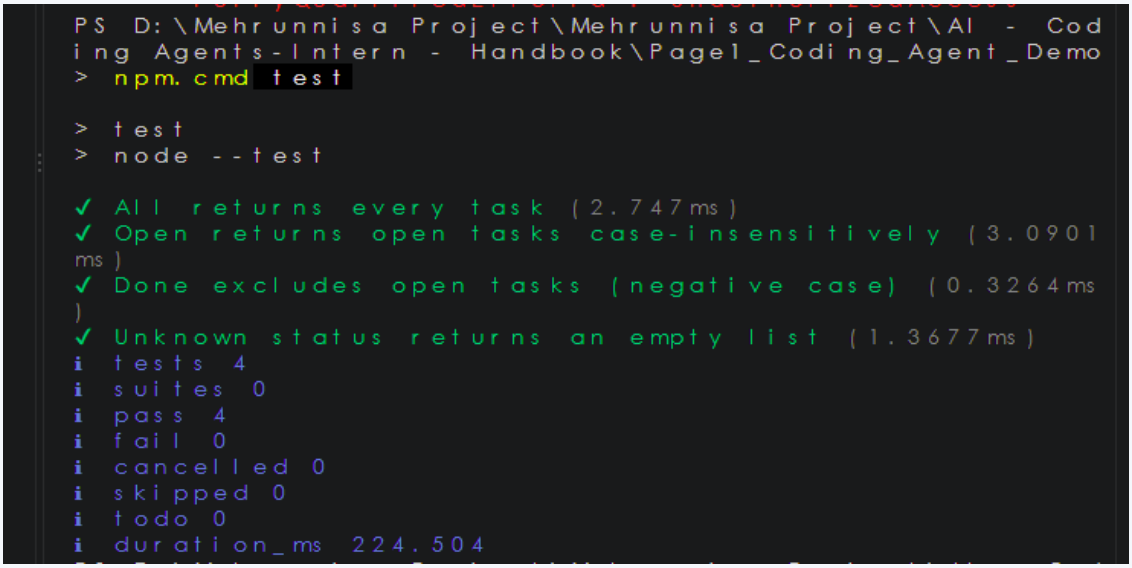
A JavaScript task-status filter uses fake in-memory data. The tests cover: **All** returns all tasks; **Open** matches case-insensitively; **Done** excludes Open tasks (negative case); and an unknown status returns an empty list.

Local verification result

Node.js	Command	Tests	Passed	Failed
v24.21.0	`npm.cmd test`	4	4	0

Actual terminal screenshot

The screenshot below is the evidence supplied from the user's local VS Code terminal.



Evidence: 4 tests passed; 0 failed.

Conclusion and limitations

The four defined test cases passed in this local run. This supports only the behaviours tested; it does not prove all possible inputs or production behaviour. The demo uses fake data and does not test a UI, API, or database. The code package was prepared separately; Cline implementation, Git commit, PR, deployment, and a deliberate failing-test experiment are not claimed.
