Page 7 Practical Report

Real Repository Daily Workflow

Date: 21 October 2026

Objective

Demonstrate a safe, scoped repository workflow with explicit verification and an evidence-based handoff.

Implementation Summary

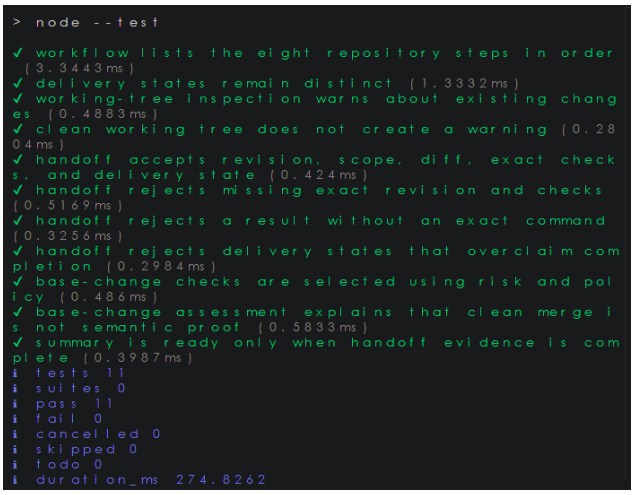

Component	Implemented behavior
Workflow	Defines eight steps from reading repository instructions and checking status through reviewing the diff, running checks, and recording the exact revision.
Working-tree protection	Warns when existing changes are present so they can be inspected and preserved before editing.
Handoff validation	Requires revision, scope, diff summary, exact check commands, results, and a recognized delivery state.
Delivery states	Keeps local tests, hosted CI, merge, and deployment as separate states.
Risk-based checks	Recommends checks based on changed files, risk level, and project policy; notes that a clean merge does not prove semantic compatibility.

Verification Results

Total Tests	Passed	Failed	Result
11	11	0	**PASS**

Test Evidence

The terminal screenshot below shows 11 tests passed and 0 failed.

Conclusion

The repository workflow demo is implemented and verified with 11 passing tests. It emphasizes preserving existing changes, limiting scope, recording exact verification evidence, and reporting delivery status accurately.
