Page 5 Practical Report

Multi-Agent System | AI Coding Agents: Intern se Confident

Date: 21 October 2026

Objective

Implement a coordinated workflow with clear roles, a delegation contract, task dependencies, file ownership checks, and review based on implementation and test evidence.

Implementation summary

Component	Implemented behavior
Coordinator	Defines task scope, delegation contract, constraints, verification, and stop conditions.
Implementation role	Owns the status-filter implementation within the specified file boundary.
Test role	Runs focused checks for status filtering and reports test results.
Review role	Checks implementation output, acceptance criteria, file boundaries, and passing test evidence.
Task graph	Final review depends on both implementation and testing.
Conflict guard	Blocks workflow when multiple roles are assigned ownership of the same file.

Workflow

Coordinator → Implementation + Test → Review → Completed / Needs work / Blocked

The workflow keeps responsibilities distinct, makes file ownership explicit, and requires review of concrete output and test evidence before completion.

Verification results

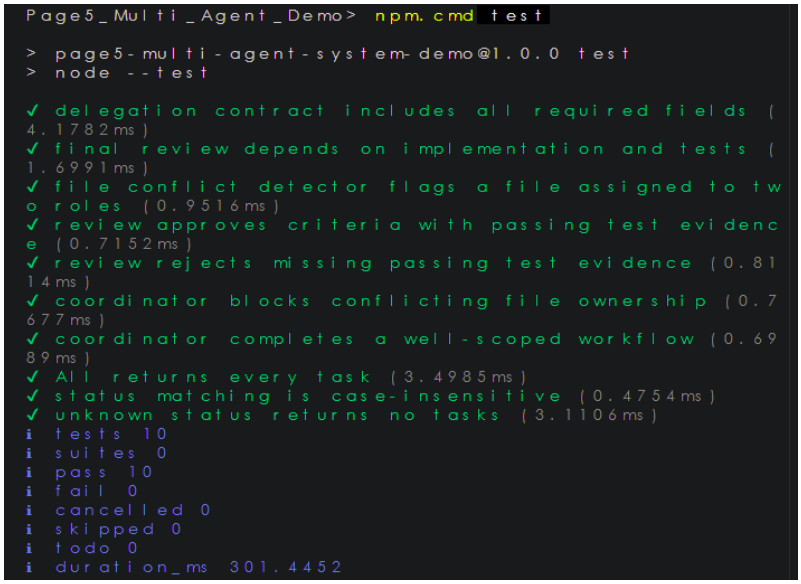

Total tests	Passed	Failed	Status
10	10	0	**PASS**

Automated test coverage

Test area	Verified behavior
Delegation contract	All required contract fields are present.
Task dependencies	Review waits for implementation and testing.
File ownership	Duplicate ownership is detected and blocked.
Evidence-based review	Review accepts criteria with passing evidence and rejects missing/failed evidence.
Status filtering	All, case-insensitive matching, and unknown-status behavior are tested.

Test evidence

The screenshot below shows the project test run with 10 tests passed and 0 failed.

Conclusion

The Page 5 multi-agent workflow has been implemented and verified with ten passing tests. The key outcome is a coordinated process with defined responsibilities, explicit file boundaries, dependency-aware review, and acceptance decisions grounded in implementation and test evidence.
