Page 9 Practical Report

Safety, Privacy and Efficiency

Date: 21 October 2026

Objective

Implement testable safety checks for sensitive-data references, untrusted task instructions, action authorization, and efficiency controls.

Implementation Summary

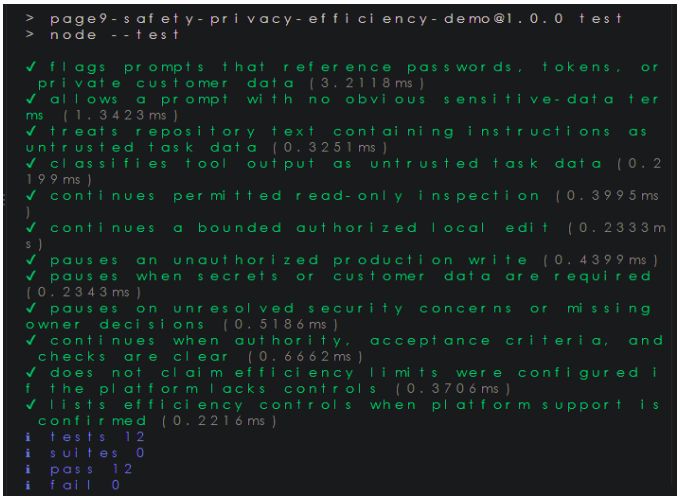

Component	Implemented behavior
Sensitive-data scan	Flags prompt references to passwords, tokens, production data, and private customer records.
Untrusted task data	Classifies repository text and tool output as untrusted task data rather than policy authority.
Action decisions	Allows authorized read-only inspection and bounded local edits; pauses or escalates when authority, data access, security, or owner decisions are unresolved.
Efficiency controls	Represents agent-count, retry, execution-time, and spend limits when platform support is confirmed; avoids claiming unavailable controls were configured.
Evidence template	Records checks, results, data-safety cases, limits, remaining limitations, and next action without exposing sensitive information.

Verification Results

Total Tests	Passed	Failed	Result
12	12	0	**PASS**

Test Evidence

The terminal screenshot below shows 12 tests passed and 0 failed.

Conclusion

The safety, privacy, and efficiency demo is implemented and verified by 12 passing tests. The checks cover sensitive-data references, untrusted instructions, action decisions, and accurate reporting of supported efficiency controls.
